9. ☐ Other \_\_\_\_\_.

The following is an examiner's statement of reasons for indicating allowance of claim 1: The prior art teaches a method for controlling a clamping voltage across a terminal of a transistor comprising providing a first clamping voltage in a conductive loop that includes the terminal of the transistor for a first specified period of time; reducing the first clamping voltage to an intermediate clamping voltage; holding the intermediate clamping voltage for a specified period of time; but does not disclose repeating the reducing and the holding until the intermediate clamping voltage is essentially equal to a final clamping voltage, wherein intervals between clamping voltage levels are equal. This feature in combination with the rest of the claim limitations is not anticipated or rendered obvious by the prior art of record.

The following is an examiner's statement of reasons for indicating allowance of claim 8: The prior art does not disclose a method for rapidly removing a current from an inductive load without current undershoot comprising setting a variable current source to produce a first current; holding the variable current source output for a first period of time; checking if a terminating condition is met; setting the variable current source to produce a second current for a second period of time, wherein the second current is smaller than the first current, if the terminating condition is not met; and repeating the checking and the setting. This feature in combination with the rest of the claim limitations is not anticipated or rendered obvious by the prior art of record.

The following is an examiner's statement of reasons for indicating allowance of claim 14: The prior art teaches a circuit comprising a driver circuit coupled to an inductive load, the driver circuit containing circuitry to control a current built up across the inductive load; and a voltage varying circuit coupled to the driver circuit, the voltage varying circuit containing circuitry to produce a sequence of voltages, but does not disclose that the voltage varying circuit comprises a variable current source to produce an output current of variable magnitude depending upon an input signal; and a snub resistor coupled in parallel to the variable current source. This feature in combination with the rest of the claim limitations is not anticipated or rendered obvious by the prior art of record.
